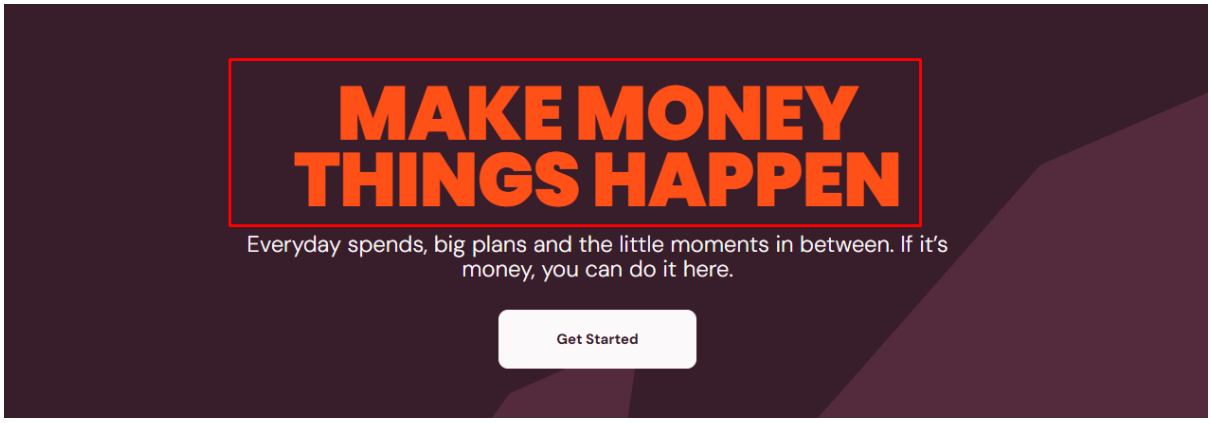
Website QA Bug Report

Product: NayaPay Public Website
URL: https://www.nayapay.com
Test Type: Manual UI / UX / Content / Accessibility Testing
Device: Desktop (Chrome – Windows)
Tester Role: QA / Product Tester

Bug 1: Incorrect Grammar in Primary Hero Headline (Critical)



Page: Home Page
Section: Hero Banner
Text Displayed:

"MAKE MONEY THINGS HAPPEN"

Issue Description

The main headline on the homepage contains a grammatical error. The sentence structure is incorrect and does not read naturally in English.

Expected Result

The headline should be grammatically correct and clearly convey the brand message. Examples of acceptable alternatives:

- "Make money **make** things happen"
- "Make things happen with your money"

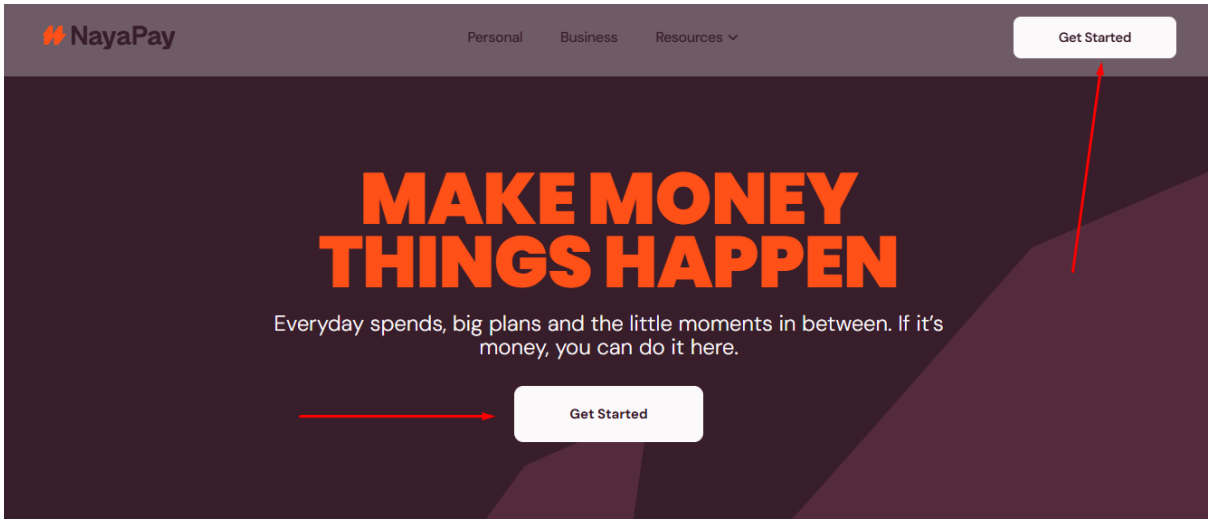
Actual Result

The current sentence is grammatically incorrect and confusing.

Impact

- Reduces brand credibility
- Creates a negative first impression
- High-risk issue for a fintech product where trust is critical

Bug 2: Duplicate Call-To-Action (CTA) Causing User Confusion (Medium – UX)



Page: Home Page
Elements:

- Top-right navigation button: "Get Started"
- Hero section button: "Get Started"

Issue Description

Two identical primary CTAs are displayed without any contextual difference. It is unclear whether both buttons lead to the same user journey or different flows.

Expected Result

- Either a single primary CTA
- Or distinct CTA labels (e.g., "Create Account", "Download App", "Get Started")

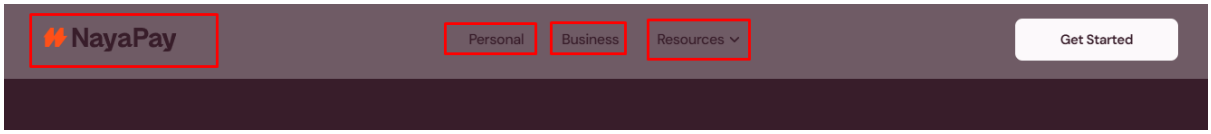
Actual Result

Both CTAs have the same label and visual priority, which may confuse users.

Impact

- Reduces clarity in user flow
- May negatively affect conversion rates

Bug 3: Low Text Contrast in Top Navigation (Accessibility Issue)



Page: Home Page
Section: Top Navigation
Items: Personal | Business | Resources

Issue Description

The navigation text has low colour contrast against the background, making it difficult to read, especially for users with visual impairments or on low-brightness screens.

Expected Result

Text contrast should comply with WCAG accessibility guidelines for readability.

Actual Result

Text appears visually muted and lacks sufficient contrast.

Impact

- Accessibility compliance risk
- Poor readability for some users

Bug 4: Missing or Low Active or Hover State Indicators in Navigation (UX)

Page: Home Page
Section: Top Navigation

Issue Description

Navigation menu items do not clearly indicate hover or active states. Users cannot easily tell which section is currently selected or interactive.

Expected Result

Clear visual feedback such as:

- Colour change

- Underline
- Smooth hover/active transition

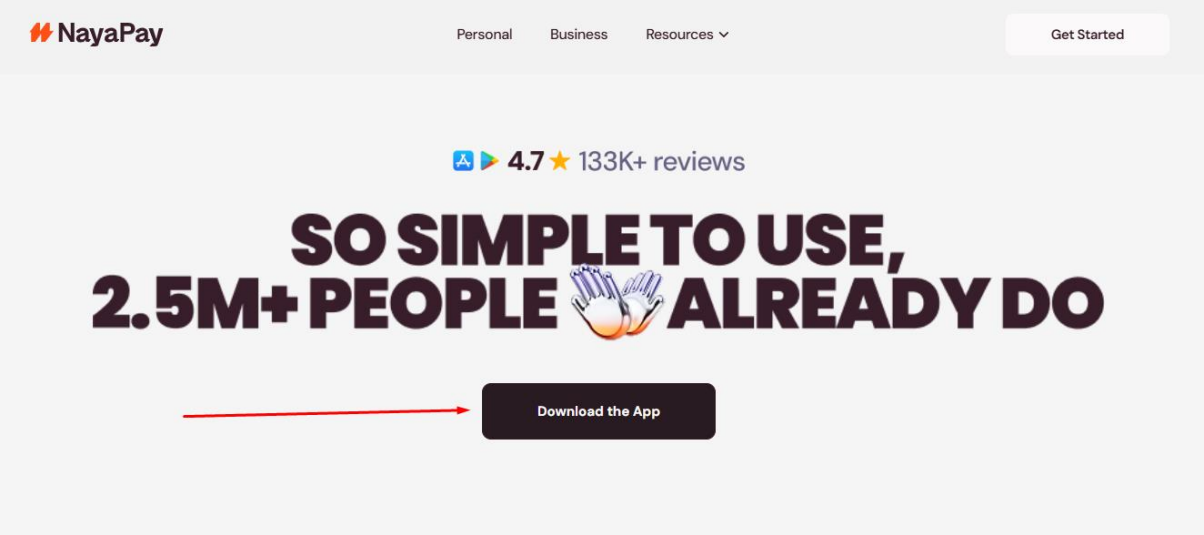
Actual Result

Minimal or no visible feedback on interaction.

Impact

- Reduced usability
- Poor navigation experience

Bug 5: Missing Hover State on “Download the App” Button



Page: Home Page
Section: Primary CTA Area (Below hero content)
Element: “Download the App” button

Issue Description

The “Download the App” button does not show any visible hover state when the cursor is placed over it. There is no visual feedback such as colour change, animation, or styling difference to indicate that the button is interactive.

Expected Result

When hovering over the button, it should provide clear visual feedback, such as:

- Background colour change
- Shadow or elevation effect
- Smooth hover animation

- Cursor pointer clearly indicating interactivity

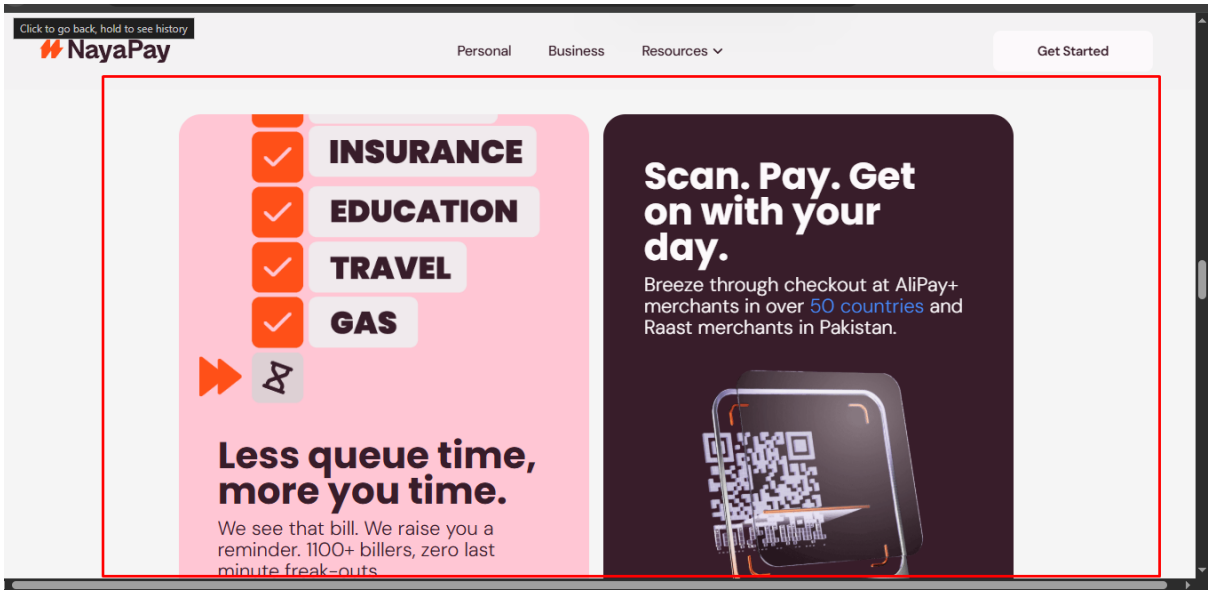
Actual Result

The button appears visually static on hover with no noticeable change, making it difficult for users to recognize it as an interactive element.

Impact

- Reduces affordance and usability
- Users may hesitate to click, assuming the button is disabled or non-interactive
- Breaks standard UI/UX design patterns for primary call-to-action buttons

Bug 6: Oversized Card Component Causing Unnecessary Scrolling



Page: Home Page
Section: Feature / Payment Information Cards
Element: Large informational card (e.g., “Scan. Pay. Get on with your day.” section)

Issue Description

The card component displayed in this section is excessively large and occupies a significant portion of the viewport. Due to its size, the card covers most of the visible screen area, forcing users to scroll in order to view the complete content and adjacent information.

Expected Result

Card components should be proportionally sized so that:

- Multiple elements can be partially or fully visible at once
- Users can understand the context of surrounding content without excessive scrolling

A slightly reduced card height would improve visual balance and readability.

Actual Result

The card occupies most of the screen height, resulting in:

- Reduced visibility of nearby content
- Additional scrolling required to view full details

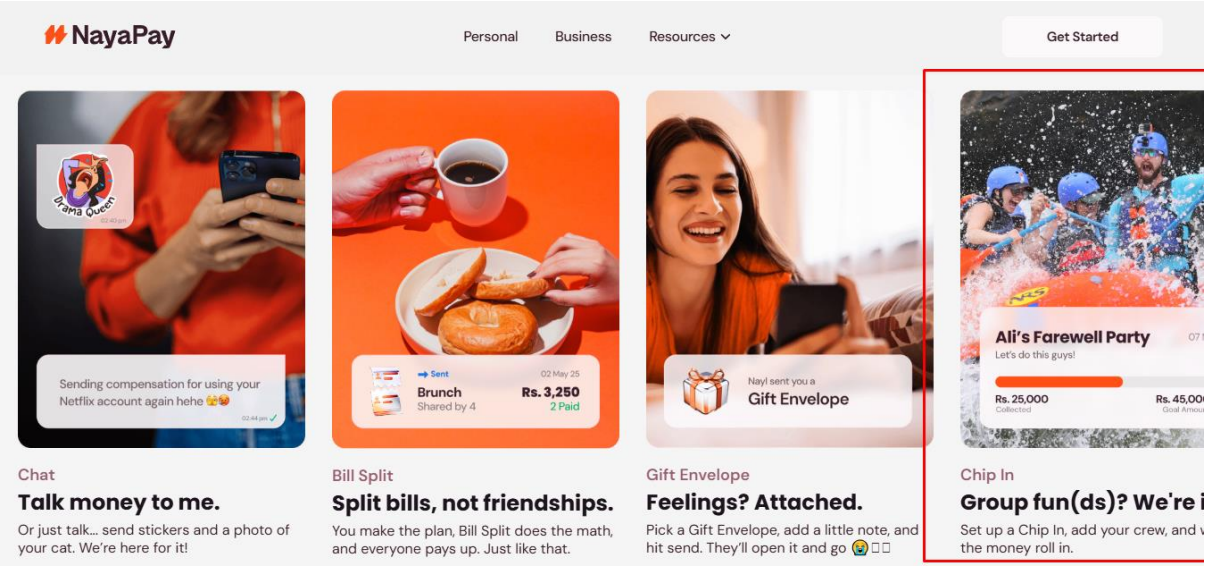
Impact

- Breaks visual hierarchy
- Reduces content discoverability
- Creates unnecessary scrolling on desktop devices
- May negatively affect user engagement

Suggested Improvement

Reducing the card height or adjusting internal spacing would create a more balanced layout and improve overall user experience.

Bug 7: Fourth Card Partially Cut Off and Not Fully Visible



Page: Home Page
Section: Feature Cards / Use-case Cards
Element: 4th card ("Chip In" / Group contribution card)

Issue Description

The fourth card in the feature cards section is not fully visible within the layout. Part of the card is cut off from the right side of the screen, causing both the visual content and text to be only partially displayed.

Expected Result

All cards should be fully visible within the viewport or container:

- No content should be cut off
- Text and images should be completely readable without horizontal clipping

Actual Result

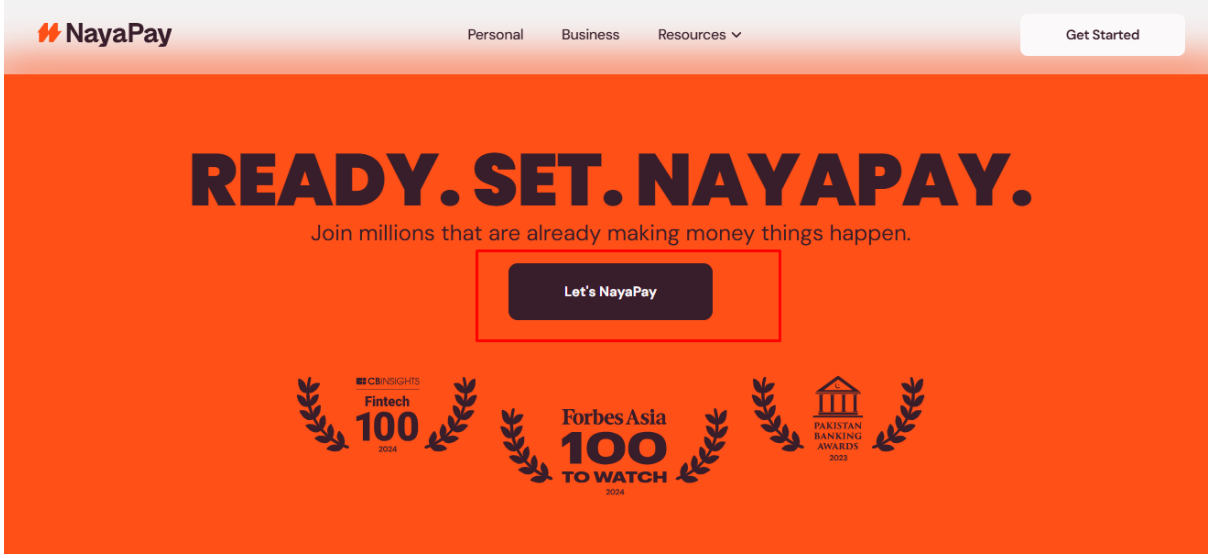
The fourth card is partially hidden:

- Right side of the card is clipped
- Text content appears incomplete
- The card does not align properly with the others

Impact

- Poor visual consistency
- Reduced readability of content
- Users may miss an important feature explanation
- Breaks layout balance and professionalism

Bug 8: Missing Hover State on “Let’s NayaPay” Primary CTA Button



Page: Home Page
Section: Final Call-To-Action (Bottom section – “READY. SET. NAYAPAY.”)
Element: “Let’s NayaPay” button

Issue Description

The primary call-to-action button labelled “Let’s NayaPay” does not display any visible hover state when the cursor is placed over it. There is no visual feedback to indicate interactivity, such as a colour change, shadow, animation, or transition.

Expected Result

The button should provide clear visual hover feedback, including but not limited to:

- Background colour or shade change
- Elevation or shadow effect
- Smooth transition animation
- Cursor pointer clearly indicating interactivity

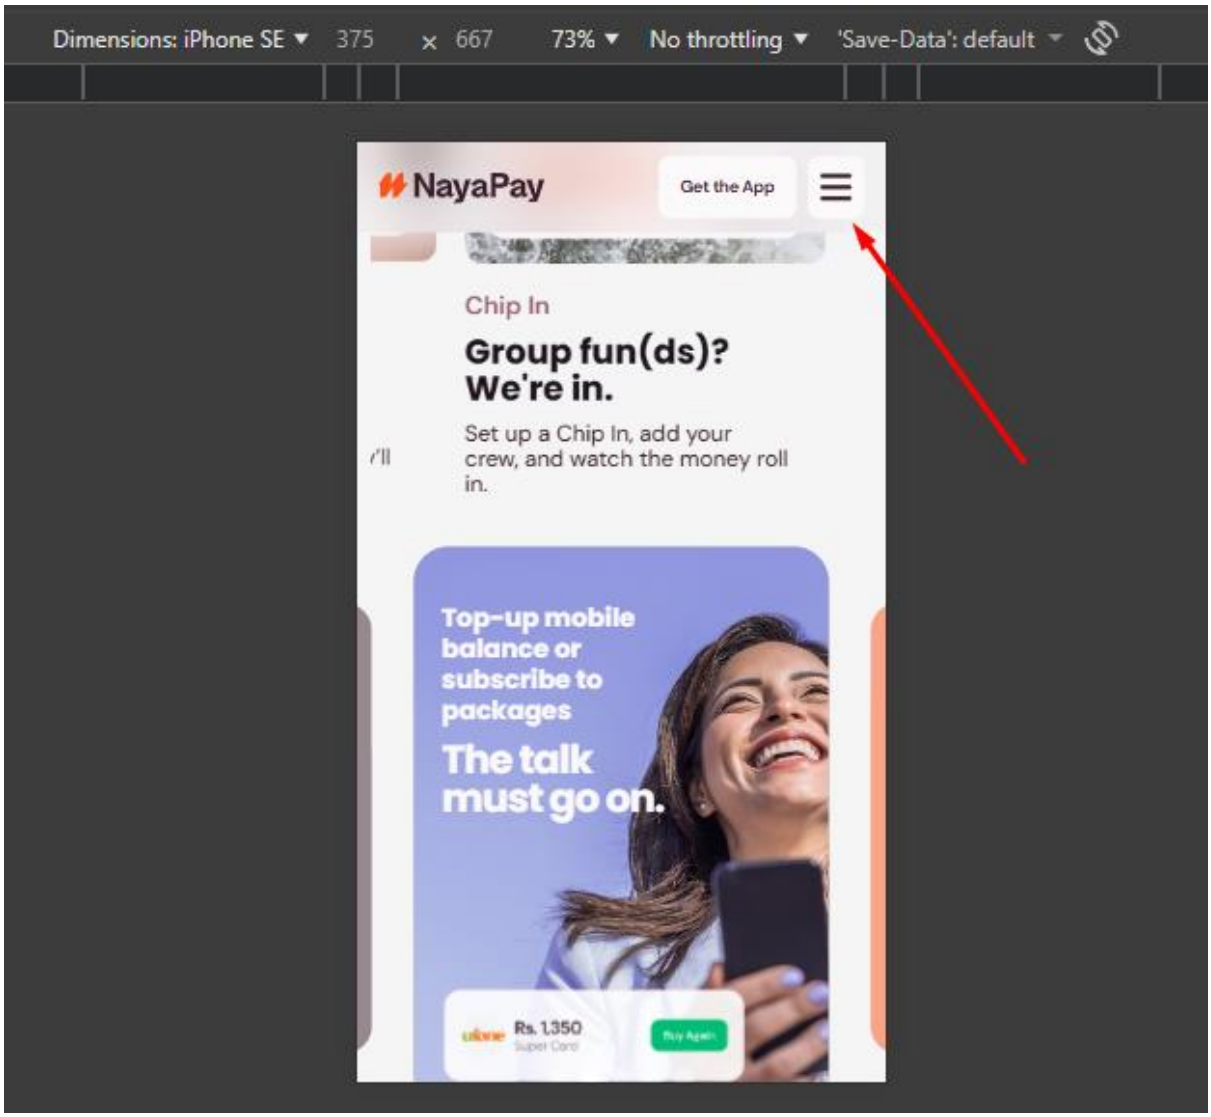
Actual Result

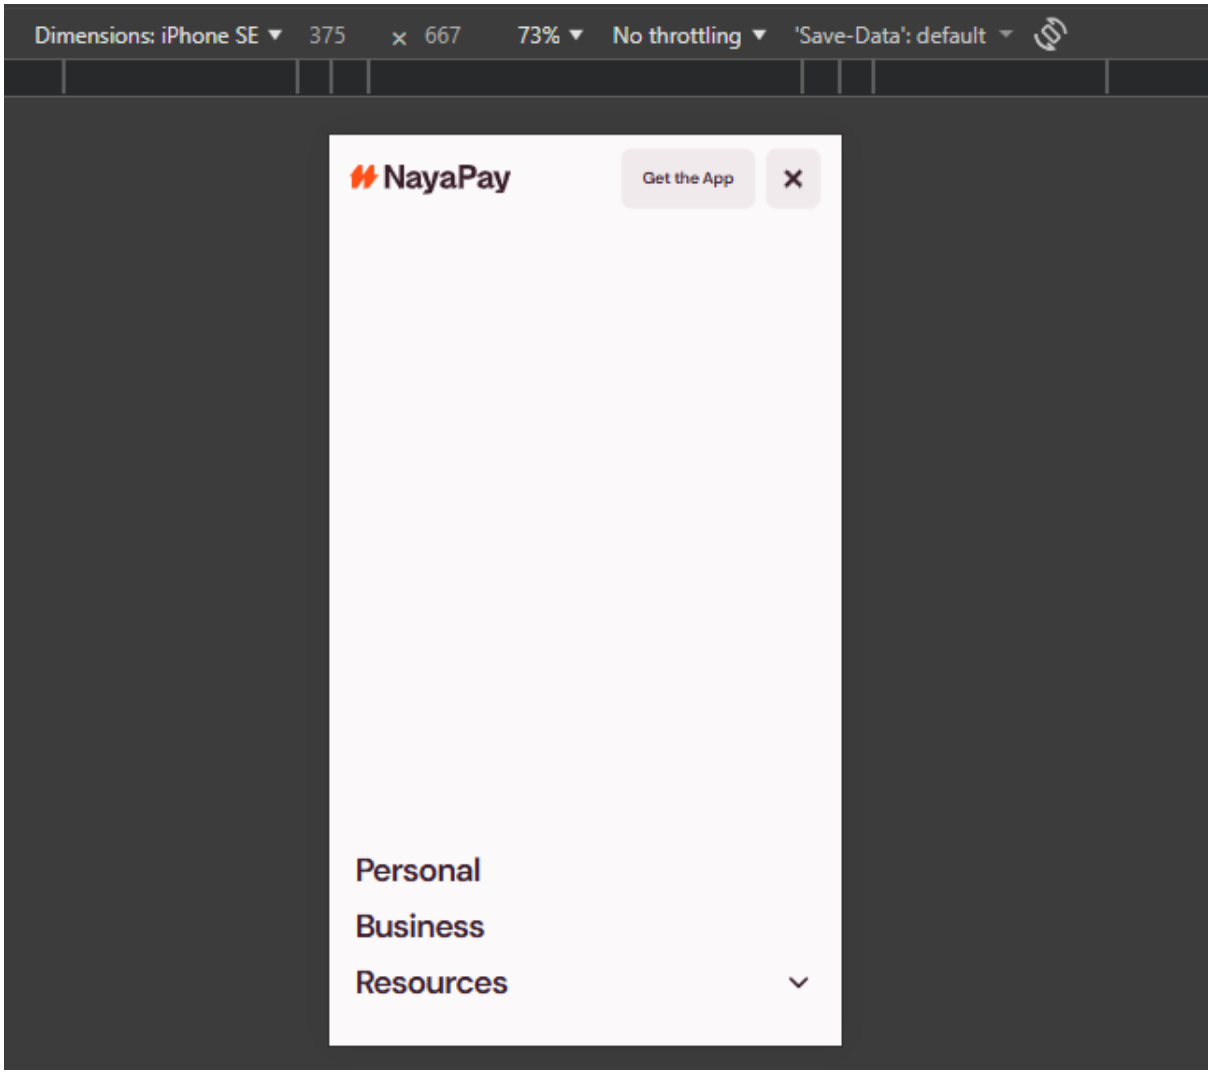
The button appears static on hover with no noticeable visual change, making it difficult to recognize as a clickable element.

Impact

- Reduced user interaction confidence
- Inconsistent CTA behaviour across the website
- Breaks standard desktop UI/UX patterns

Bug 9: Mobile Navigation Menu Layout Appears Misaligned and Visually Unbalanced





Page: Home Page
Device: Mobile (iPhone SE – 375×667)
Section: Mobile Header / Hamburger Menu
Element: Hamburger menu (three-line icon)

Issue Description

When the hamburger (three-line) menu is tapped on mobile view, the navigation menu opens but the menu items (Personal, Business, Resources) appear pushed too far down the screen. This creates excessive empty space at the top and makes the layout feel visually unbalanced and unfinished.

Expected Result

The mobile navigation menu should:

- Appear properly aligned within the viewport
- Display menu items closer to the top header area

- Maintain a compact, visually balanced layout

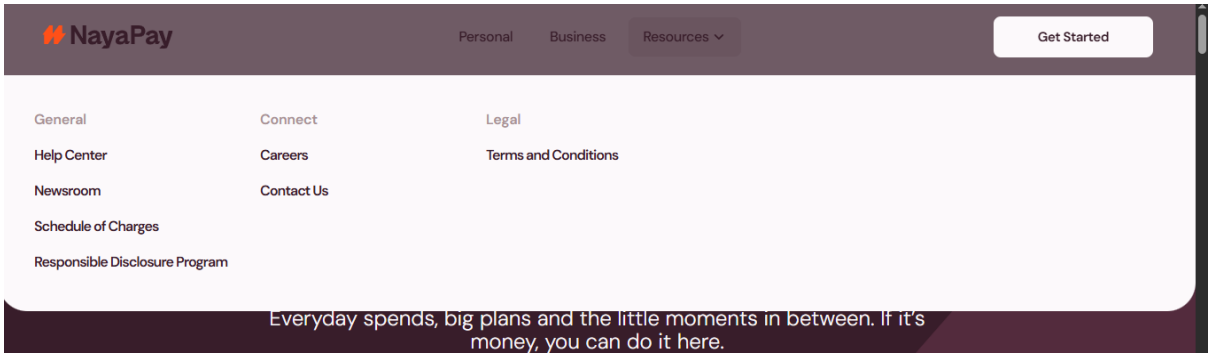
Actual Result

- Menu items appear significantly lower than expected
- Large empty space is visible above the navigation links
- The layout feels stretched and visually awkward

Impact

- Poor mobile user experience
- Reduced visual hierarchy and clarity
- Makes the navigation feel unpolished and less intuitive
- Particularly noticeable on smaller screen devices

Bug 10: Navigation Menu Alignment



Page: Homepage

Section: Header / Navigation Bar ("Resources" Drop-down)

Issue Description

The content within the "Resources" drop-down menu is improperly aligned. The text items are heavily shifted to the left with inconsistent padding, creating a cluttered visual appearance.

Expected Result

The drop-down menu items should be cantered or have balanced padding/margins for better readability and aesthetic symmetry.

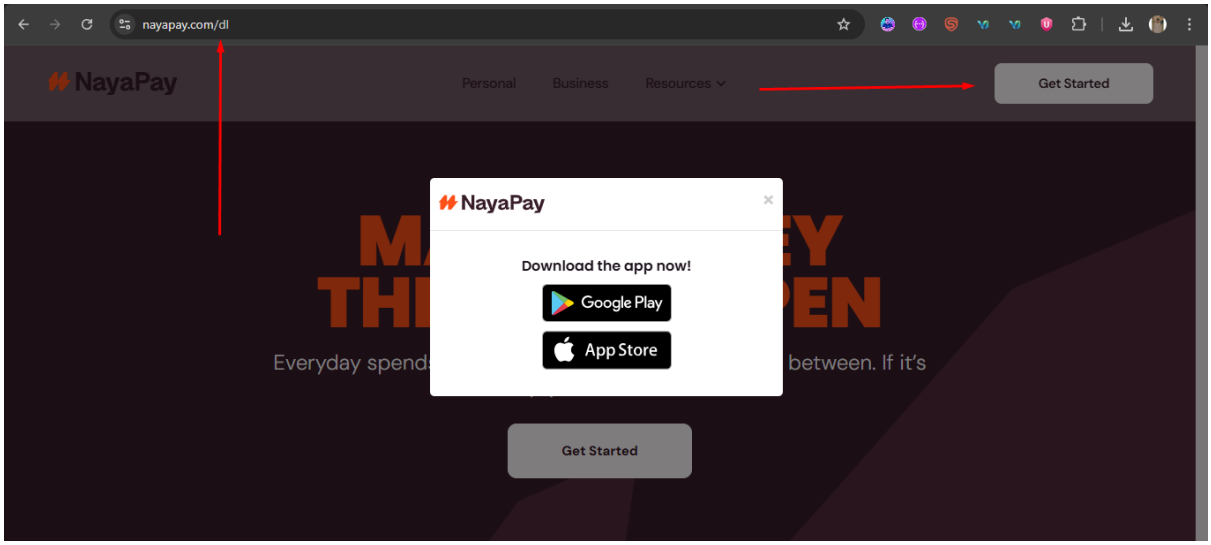
Actual Result

Menu items like "Help Centre," "Newsroom," and "Careers" appear cramped against the left edge of the container.

Impact

It affects the brand's professional image and makes it harder for users to quickly scan the navigation options.

Bug 11: URL Manipulation on Modal Trigger (Critical)



Issue

When clicking the top-right **"Get Started"** or **"Download the App"** buttons, the URL changes from nayapay.com → nayapay.com/dl **even though no new page loads** (only a modal/popup appears).

Why it's a bug:

- This is a **client-side routing flaw**. The URL should **not change** for a modal (it's not a new page).
- Causes confusion with browser navigation (e.g., back button behaviour, bookmarking).
- If users refresh the page at nayapay.com/dl, they see the modal *without context*, which breaks the user flow.

How to reproduce:

1. Open nayapay.com.
2. Click "Get Started" (top-right).
3. Observe URL changes to nayapay.com/dl (no page reload occurs).
4. Refresh the page → modal appears unexpectedly.

Final Recommendations:

1. **Standardize hover states** across all primary CTA buttons to improve interaction clarity.
2. **Optimize layout and card dimensions** to reduce unnecessary scrolling and content clipping on both desktop and mobile.
3. **Improve mobile navigation alignment** to deliver a cleaner and more polished experience on smaller devices.

All feedback is shared with the intent of improving product quality and user experience.
